

# HU, HCF, HCR Unit Heaters Technical Guide

**STEAM AND HOT WATER HEATERS TO PROVIDE A COMFORTABLE ENVIRONMENT IN OPEN AREAS**

**S**ince 1875, the L.J. Wing Company has been a leader in providing innovative solutions for difficult HVAC problems. Wing HU, HCF, and HCR Unit Heaters offer efficient air heating with steam or hot water for large open areas. This technical guide will help you size, select and specify the proper HU, HCF, or HCR model to satisfy your project's heating requirements. If you have questions, please contact your local L.J. Wing representative; he will be glad to assist you.

4830 Transport Drive, Dallas, TX 75247 Tel. (214) 638-6010 Fax (214) 905-0806

# PRODUCT DESCRIPTION

## Product Offering

Wing unit heaters are available in three different models:

**Type HU** – Horizontal airflow with three different designs of adjustable discharge blades;

**Type HCF** – Vertical airflow with three different styles of fixed discharges;

**Type HCR** – Vertical airflow with four different styles of Wing’s unique revolving discharge.

A wide range of sizes is offered for HU, HCF, and HCR models as shown below.

Wing’s revolving discharge develops a sweeping flow of air in a circular pattern. The discharge is driven by Wing’s Positrack®, a small, high-torque gear motor that slowly rotates the discharge at one RPM by means of an idler gear drive.

Type 4R and 5R discharge designs have adjustable louvers, while type 8R and 10R have adjustable deflectors. Proper positioning of the louvers or deflectors assures maximum floor coverage commensurate with mounting height.

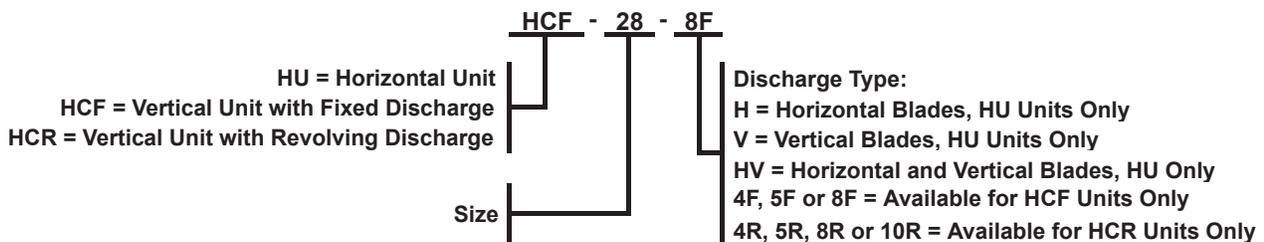

### Motor and Sound Data

SIZE	CFM (AT INLET)	MOTOR HP	MOTOR RPM	SOUND PRESSURE LEVEL (dBA) AT DISTANCE FROM UNIT				SOUND POWER LEVEL (dB)
				5'	10'	20'	30'	
2.5*	750	1/20	1,550	57.8	51.8	48.3	45.8	73.1
13	885	1/6	1,750	55.7	49.7	46.2	43.7	78.0
15	1,200	1/6	1,150	57.1	51.1	47.6	45.1	79.0
17	1,400	1/6	1,150	55.9	49.9	46.4	43.9	79.0
18	1,700	1/4	1,750	57.0	51.0	47.5	45.0	80.0
19	2,000	1/4	1,150	59.1	53.1	49.6	47.1	82.0
20	2,550	1/3	1,750	60.5	51.5	51.0	48.5	82.0
22	2,750	1/4	1,150	61.2	55.2	51.7	49.2	84.4
23	3,600	1/2	1,150	63.6	57.6	54.1	51.6	86.0
25	4,300	1/2	1,150	76.8	70.8	67.3	64.8	96.3
26	5,500	3/4	1,150	78.4	72.4	68.9	66.4	98.0
28	6,500	3/4	850	74.3	68.3	64.8	62.3	92.5
30	7,000	3/4	850	75.1	69.1	65.6	63.1	92.5
33	8,700	1	850	76.6	70.6	67.1	64.6	94.5
36	10,000	1 1/2	850	77.1	71.1	67.6	65.1	95.0
38	13,000	2	850	79.0	73.0	69.5	67.5	97.0
40	16,500	3	850	80.2	74.2	70.7	68.2	99.0
43	21,500	5	850	83.5	77.5	74.0	71.5	101.5
44	27,000	7 1/2	850	84.9	78.9	75.4	72.9	102.5

Notes: \* Available for HU models only.

1. Integral OSHA-approved fan guards are furnished as standard on all units up to and including size 26. For larger sizes, OSHA-approved fan guards are optional.
2. All units are direct-driven. Sizes 28 through 44 units in optional belt drive configuration are available with 1,750 RPM motors.

## Model Number Description

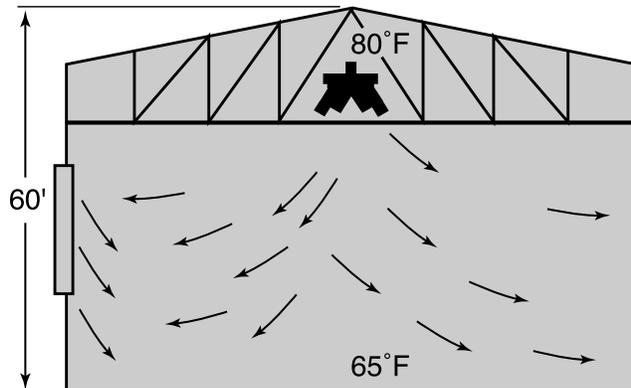

# SELECTION

## General Guidelines

The first step in selection should be the calculation of the building heat loss.

The next step is to look at individual Wing unit heater capacities, heating coverage and mounting height data. You will find that with Wing's large capacity/coverage models, fewer heaters will be required. This will reduce the cost of installation, piping, wiring and controls. In addition, ongoing savings in operating and maintenance costs will be achieved.

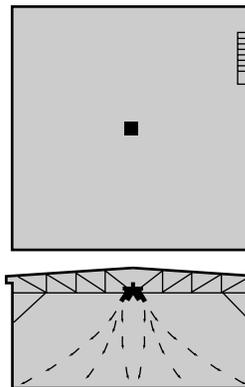

Wing heaters can be mounted high in truss or ceiling areas, freeing up valuable floor space and recirculating stratified air as they operate. Type HU horizontal unit heaters are available for maximum mounting heights up to 28 feet. This makes them ideal for buildings with lower ceiling heights. For taller buildings, type HCF and HCR unit heaters offer mounting heights up to 73 feet.

*Wing vertical unit heaters minimize stratification by drawing in hot air from the truss area and distributing it to the floor level. They reduce the floor-to-ceiling temperature gradient, reduce roof heat loss, and conserve fuel.*

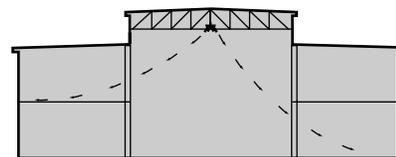

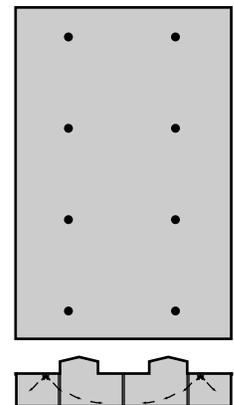

Using capacities at up to 5 lb. Steam and published mounting heights and coverage will insure the proper velocity and temperature of the air as it reaches the comfort level, 5 to 6 feet above the floor. For higher steam pressures we recommend that heater sections be factory adjusted to maintain the 5 lb. level.

Select the type of discharge with the lowest maximum mounting height suitable for the installation. Keep in mind that revolving discharges are especially useful for installations where machinery or storage racks would make air distribution with fixed discharges difficult. The gentle sweeping motion of the revolving discharge insures better overall coverage with minimal temperature gradients from floor to ceiling.

*Typical monitor-style building is very satisfactorily heated by type HCF or HCR unit heaters, located high in the center, where they are out of the way of cranes.*

*Wide double monitor-style building is easily heated with two rows of HCF or HCR unit heaters, Building is 360' by 240' and heaters are mounted 32 ft. high where they do not interfere with cranes.*

*Two floor levels are perfectly heated with only one Wing type HCR unit heater. This is accomplished by adjusting the discharge outlets so that one outlet covers the upper floor or balcony while the other covers the ground floor.*

# SELECTION AND PERFORMANCE

## Unit Selection Procedure and Steam Performance Data

### Steam Performance

For 5 psig operation:

1. Read the heat transfer, Q, and leaving air temperature, LAT, directly from the table below.
2. Calculate CL = (Q x 1,000)/LH (where LH = Latent Heat from Latent Heat table).

For 2 psig operation:

1. Multiply the table value of Q by 0.95
2. Calculate CL = (Q x 1,000)/LH
3. Calculate Air Temperature Rise, ATR:  
 $ATR = (Q \times 1,000) / (1.085 \times CFM)$ , where CFM is obtained from the Motor and Sound Data table.
4. Calculate LAT = EAT + ATR.

For operation at pressures higher than 5 psig:

The heating surface is factory adjusted so the heater will deliver the same Q and LAT as shown in the table.

1. Read Q and LAT from table for 5 psig.
2. Calculate CL = (Q x 1,000)/ LH.

**Example A:** Calculate the performance for a size 20 heater at 5 psig and EAT = 60° F.

**Solution:**

1. Q = 167.8 MBH and LAT = 121° F.
2. CL = (167.8 x 1,000)/961 = 175 lbm/hr.

**Example B:** Calculate the performance for a size 20 heater at 2 psig and EAT = 60° F.

**Solution:**

1. Q = 0.95 x 167.8 = 159.4 MBH.
2. CL = (159.4 x 1,000)/966 = 165 lbm/hr.
3. ATR = (159.4 x 1,000)/(1.085 x 2,550) = 58° F.
4. LAT = 60 + 58 = 118° F.

### Hot Water Performance

1. Given the Water Temperature Drop, WTD, through the heater, read the standard heat transfer, QS, and standard water flow rate, GPMS, from the Hot Water Performance Table at EWT = 200° F and EAT = 60° F.
2. Look up the Hot Water Performance Correction Factor, WPF, from the table on page 6 at the given EWT and EAT.
3. Calculate Q = WPF x QS
4. Calculate WTD = (Q x 1,000)/(495 x GPMS)
5. Look up the CFM for the unit from the Motor and Sound Data table.
6. Calculate ATR = (Q x 1,000)/(1.085 x CFM)
7. Calculate LAT = EAT + ATR.
8. Read Water Pressure Drop, WPD, from the Hot Water Performance table.

**Example:**

Determine the performance of a size 40 heater with EWT = 190° F, EAT = 55° F, and WTD = 15° F.

**Solution:**

1. QS = 652.9 MBH and GPMS = 87.8.
2. WPF = 0.97.
3. Q = 0.97 x 652.9 = 633.3 MBH.
4. WTD = (633.3 x 1,000)/(495 x 87.8) = 14.6° F.
5. CFM = 16,500.
6. ATR = (633.3 x 1,000)/(1.085 x 16,500) = 35° F.
7. LAT = 55 + 35 = 90° F.
8. WPD = 5.1 ft. H2O.

**Note:** For performance with other tube or fin materials, or with other water flow rates, or with glycol solutions, please consult your local Wing representative.

Notes:

- MH = Mounting height in feet;  
CF = Coverage in feet for a fixed discharge;  
CR = Coverage in feet for a revolving discharge.
- Mounting height is the distance from the floor to the bottom of the discharge outlet.
- Mounting height and coverage are based on 115 deg. F EAT and 65 deg. F floor temperature. For operation at other conditions, consult your Wing representative for recommendations.

44	28	180	28	180	28	180

Notes:

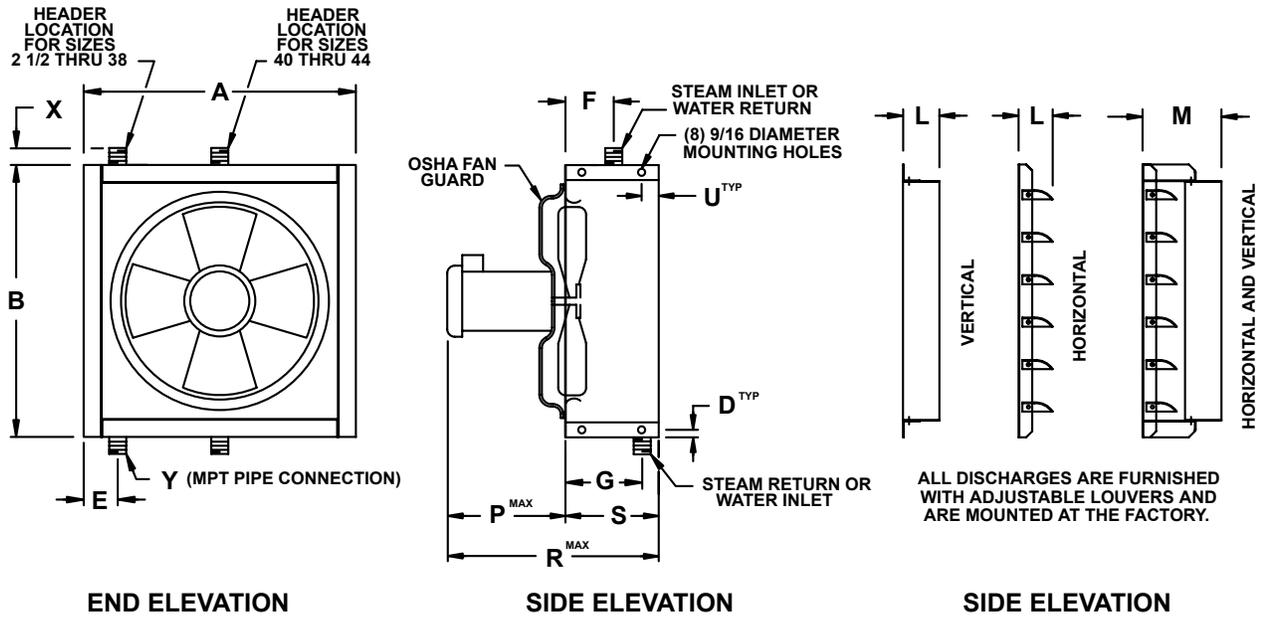

- 1 MH = Mounting height in feet;  
EHT = Effective Heating Throw in feet.
- 2 Mounting height is the distance from the floor to the bottom of the discharge outlet.
- 3 Mounting height and coverage are based on 115 deg. F EAT and 60 deg. F floor temperature. For operation at other conditions, consult your Wing representative for recommendations.

#### NOTES:

1. All dimensions in inches.
2. Values shown for D4, D5, D8, and D8A apply to revolving discharge only. To get dimension of fixed discharge, subtract 13/16" from values shown for sizes 13 through 33 and for larger sizes, subtract 1 3/4".
3. To get overall unit height including the discharge, add dimension R from page 11 plus 3" for a standoff channel, plus either D4, D5, D8, or D10 as appropriate from the above table.

5. ⊗ - TERMINAL BLOCK.
6. ○ - RECOMMENDED CONNECTIONS FOR CONTROL COMPONENTS.

## Wiring

Fan motors on HU-2.5 heaters are equipped with internal thermal overload protection. All other units should be equipped with either a manual or a magnetic starter. (Both of these items are available as options). They may be factory-mounted and wired or shipped loose. For your convenience, both NEMA-rated and IEC-rated starters are offered. Please note that HU-2.5 units cannot be fitted with a unit-mounted starter and/or disconnect due to the unit's small size.

Smaller single-phase motors may be controlled with a line voltage thermostat, while larger single phase and all three phase motors require a magnetic starter, with the thermostat controlling the holding coil.

Models equipped with revolving discharges are supplied with the "R" drive motor pre-wired. Units supplied for any electrical service other than 115 volts/single-phase or 230 volts/three-phase are factory equipped with a step-down transformer.

Fan motors, "R" Drive (revolving discharge) motors, and room thermostats are available in explosion-proof versions. The required Division, Class, and Group must be known to properly select explosion-proof items.

# ELECTRICAL

## Amp Draw Table

ITEM	SOURCE	ELECTRICAL SERVICE	MOTOR AMPS AT GIVEN MOTOR HORSEPOWER										
			1/6	1/4	1/3	1/2	3/4	1	1 1/2	2	3	5	7 1/2

		575V 3 Ph	0.5	0.5	0.6	0.9	1.3	1.7	2.4	2.7	3.9	6.1	9.0
B	Control Transformer	ELECTRICAL SERVICE	CONTROL CIRCUIT AMPS										
		115 V 1 Ph	0.9										
		208V 3 Ph	0.5										
		230V 3 Ph	0.4										
		460V 3 Ph	0.2										
		575V 3 Ph	0.2										

### NOTES:

1. For motors smaller than 1/2 HP, motor amps are based on motors as manufactured by Baldor; for larger motor HP, motor amps are based on latest version of the National Electrical Code.
2. Control circuit amps are based on standard controls and a 100va-rated transformer.
3. Steps to size optional disconnect switch:
  - A. Using the required fan motor HP from page 4 and the given electrical service, look up the fan motor amp draw from Item A in the above chart.
  - B. Look up the control circuit amps from Item B in above chart.
  - C. Add Fan Motor amps from Step A to Control Circuit amps of Step B, then multiply result by 1.25 to get required size of optional disconnect switch.

# SPECIFICATIONS AND SCHEDULE

## Typical Specification

### General

Furnish a factory-assembled HU, HCF, HCR model unit heater as manufactured by L.J. Wing, Dallas, TX. Unit shall heat air using steam or hot water as the heating medium with performance as shown in the schedule. Finned heating elements shall be fabricated of seamless return bend type 3/8" o.d. copper tubes with rectangular 0.010" thick aluminum fins. Each tube shall be secured to the headers by a brazed joint. The opposite end of the tubes shall be secured by channel-shaped retainers that permit expansion and contraction. Finned elements shall be factory tested with 200 psig steam and 500 psig hydrostatic pressure.

Unit shall have a propeller type fan blade driven by a TEFC motor (**optional:** explosion-proof direct drive motor) with electrical characteristics as scheduled. Each unit shall be provided with a non-overloading fan wheel directly connected to a constant speed motor with prelubricated, sealed ball bearings. The fan wheel shall be dynamically balanced and used in conjunction with an inlet venturi.

Casing and discharge shall be constructed of galvanized sheet metal painted inside and out with an air-dried alkyd enamel finish.

### Discharge

#### HU units only:

Unit shall be fitted with (type H discharge with horizontal blades; type V discharge with vertical blades; type HV discharge with horizontal and vertical blades) to provide maximum throw of the heated air. Blades shall be adjustable.

#### HCF units only:

Unit shall be fitted with (type 4F, 5F or 8F discharge) to provide proper coverage at the floor.

#### HCR units only:

Unit shall be provided with a (type 4R, 5R, 8R or 10R) revolving discharge consisting of a gear-driven revolving outlet mounted on a sheet steel air chamber that is properly balanced and suspended from the unit casing on a dual, prelubricated, sealed ball bearing assembly. (Type 8R and 10R only: Each outlet opening shall be fitted with adjustable deflectors to permit adjusting the discharged air to provide proper coverage at the floor.)

### Controls (optional)

(A) Furnish a remote control panel with NEMA 1 housing, contactors, overload relays, line voltage to 120-volt transformer, line and control terminal strips.

(B) Furnish magnetic motor starter that is (shipped loose; mounted and wired).

(C) Furnish (non-fused; fused) disconnect switch that is (shipped loose; mounted and wired).

## Typical Schedule

Model no.	Airflow Rate (scfm)	Ent. Air Temp. (deg. F)	Leav. Air Temp. (deg. F)	Steam Pressure (psig)	Heat Transfer (MBH)	Condensate load (lbm/hr)	Electrical Service (volt/ph./Hz)	Motor Horsepower (HP)
HU-20-HV	2,550	60	121	5	168	175	230/3/60	1/3
